Franz Och

Because we want to provide everyone with access to all the world's information, including information written in every language, one of the exciting projects at Google Research is machine translation... Now you can see the results for yourself. We recently launched an online version of our system for Arabic-English and English-Arabic. Try it out!

# Neural Machine Translation

EMNLP 2014  
Kyunghyun Cho et al

The source text is encoded by one neural network, and then another neural network decodes it back to the text, but, in another language. The decoder only knows its language. Both have no idea about the each other, and each of them knows only its own language. Interlingua is back.

# Lexical Translation

- How do we translate a word? Look it up in the dictionary

*Haus : house, home, shell, household*

- Multiple translations
  - Different word senses, different registers, different inflections (?)
  - *house, home* are common
  - *shell* is specialized (the Haus of a snail is a shell)

# How common is each?

Translation	Count
house	5000
home	2000
shell	100
household	80

# MLE

$$\hat{p}_{\text{MLE}}(e \mid \text{Haus}) = \begin{cases} 0.696 & \text{if } e = \text{house} \\ 0.279 & \text{if } e = \text{home} \\ 0.014 & \text{if } e = \text{shell} \\ 0.011 & \text{if } e = \text{household} \\ 0 & \text{otherwise} \end{cases}$$

# Lexical Translation

- Goal: a model  $p(\mathbf{e} \mid \mathbf{f}, m)$
- where **e** and **f** are complete English and Foreign sentences

$$\mathbf{e} = \langle e_1, e_2, \dots, e_m \rangle \quad \mathbf{f} = \langle f_1, f_2, \dots, f_n \rangle$$

The diagram consists of two blue arrows. One arrow points from the symbol **e** to the sequence  $\langle e_1, e_2, \dots, e_m \rangle$ . Another arrow points from the symbol **f** to the sequence  $\langle f_1, f_2, \dots, f_n \rangle$ .

# Lexical Translation

- Goal: a model  $p(\mathbf{e} \mid \mathbf{f}, m)$
- where  $\mathbf{e}$  and  $\mathbf{f}$  are complete English and Foreign sentences
- Lexical translation makes the following **assumptions**:
  - Each word  $e_i$  in  $\mathbf{e}$  is generated from exactly one word in  $\mathbf{f}$
  - Thus, we have an *alignment*  $a_i$  that indicates which word  $e_i$  “came from”, specifically it came from  $f_{ai}$ .
  - Given the alignments  $\mathbf{a}$ , translation decisions are conditionally independent of each other and depend *only* on the aligned source word  $f_{ai}$ .

# Lexical Translation

- Putting our assumptions together, we have:

$$p(\mathbf{e} \mid \mathbf{f}, m) = \sum_{\mathbf{a} \in [0, n]^m} p(\mathbf{a} \mid \mathbf{f}, m) \times \prod_{i=1}^m p(e_i \mid f_{a_i})$$

Alignment  $\times$  Translation | Alignment

# Lexical Translation

$$p(e_i \mid f_{a_i})$$

```
graph TD; A[p(e_i | f_{a_i})] --> B[p(house | Haus)]; A --> C[p(shell | Haus)]
```

**Remember bigram models...**

# Lexical Translation

- Putting our assumptions together, we have:

$$p(\mathbf{e} \mid \mathbf{f}, m) = \sum_{\mathbf{a} \in [0, n]^m} p(\mathbf{a} \mid \mathbf{f}, m) \times \prod_{i=1}^m p(e_i \mid f_{a_i})$$

Alignment  $\times$  Translation | Alignment

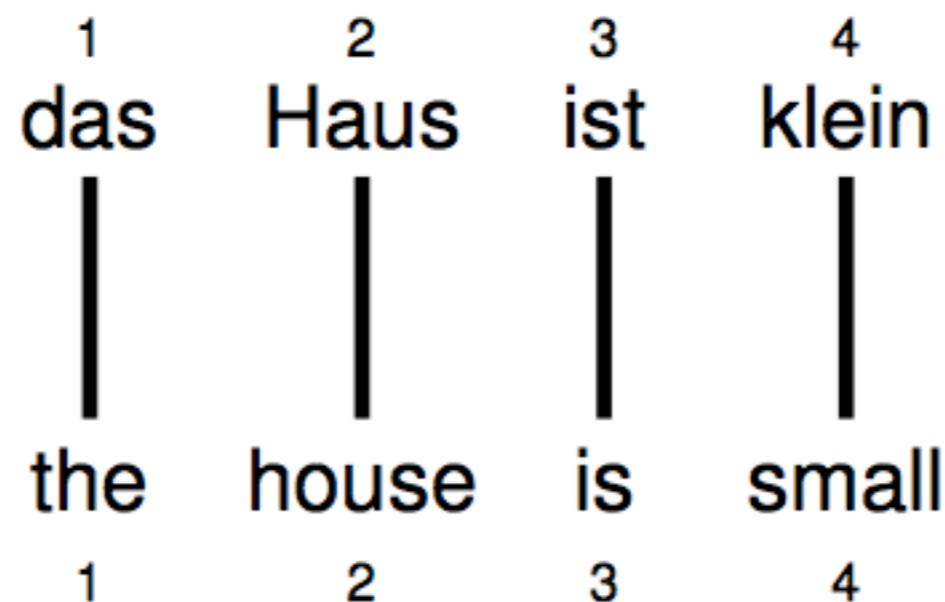

# Alignment

$$p(\mathbf{a} \mid \mathbf{f}, m)$$

Most of the action for the first 10 years of SMT was here. Words weren't the problem, word *order* was hard.

# Alignment

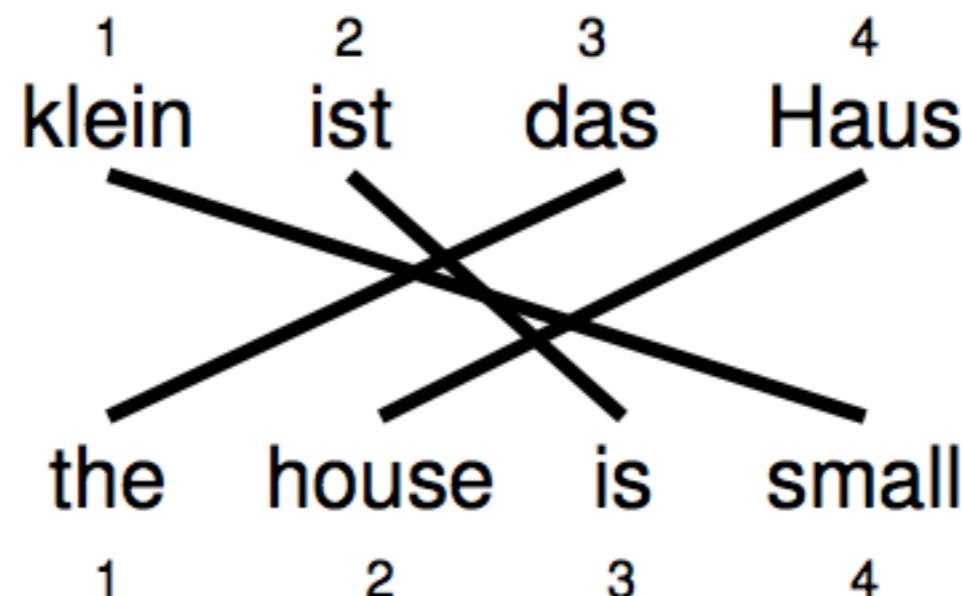

- Alignments can be visualized by drawing links between two sentences, and they are represented as vectors of positions:

$$\mathbf{a} = (1, 2, 3, 4)^\top$$

# Reordering

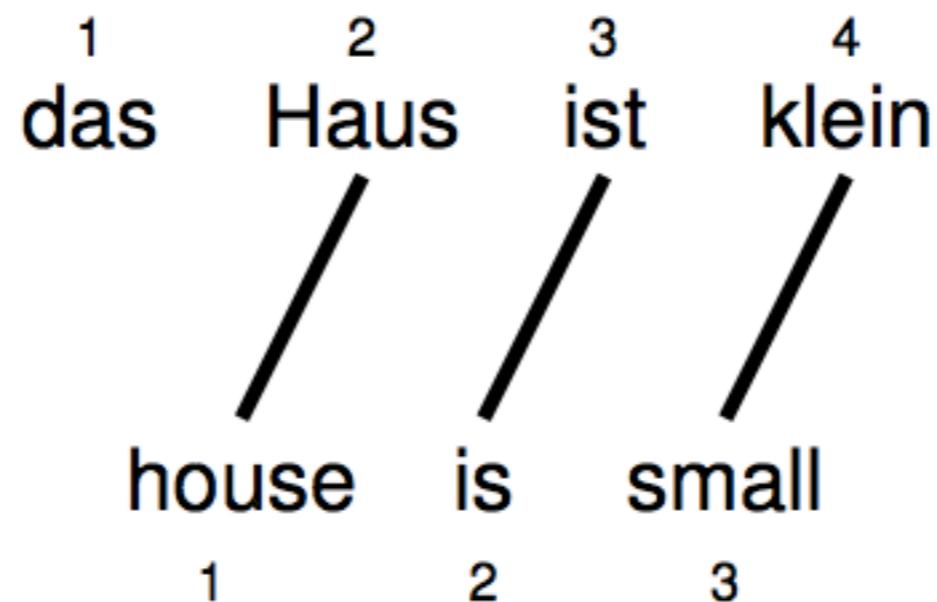

- Words may be reordered during translation.

$$\mathbf{a} = (3, 4, 2, 1)^\top$$

# Word Dropping

- A source word may not be translated at all

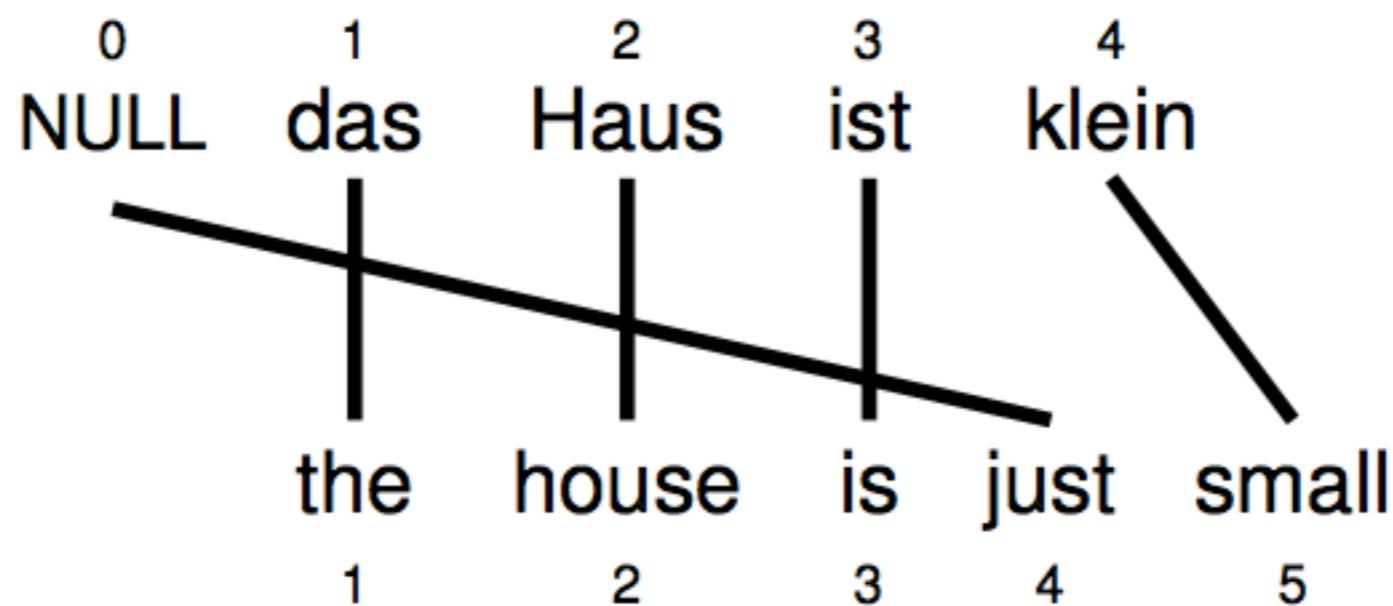

$$\mathbf{a} = (2, 3, 4)^\top$$

# Word Insertion

- Words may be inserted during translation  
English **just** does not have an equivalent

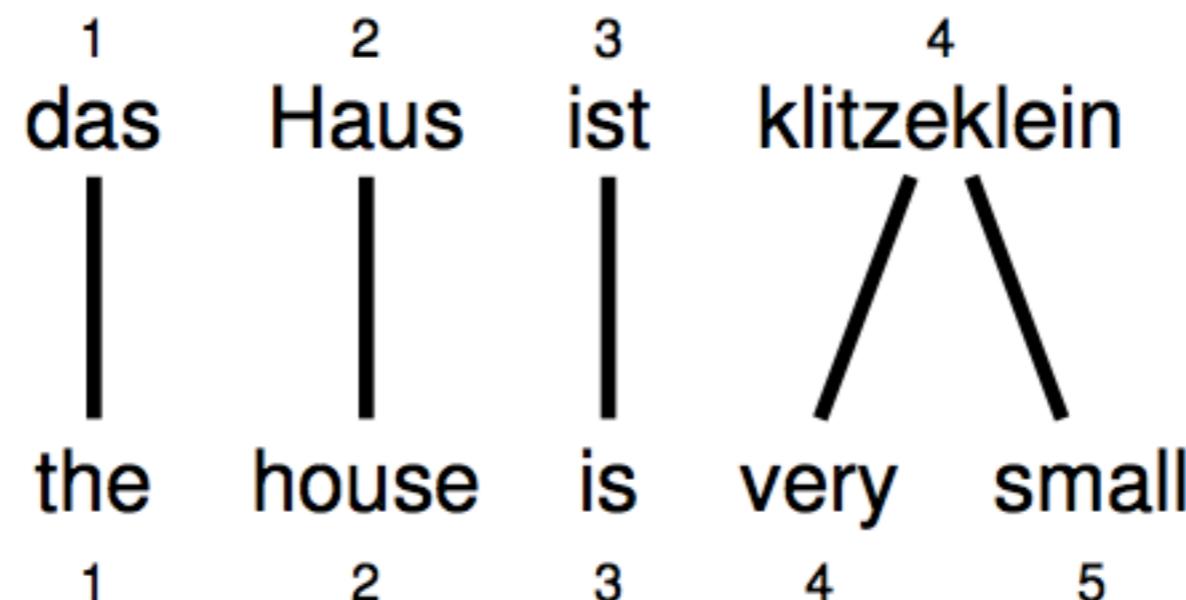

But it must be explained - we typically assume every source sentence contains a **NULL** token

$$\mathbf{a} = (1, 2, 3, 0, 4)^\top$$

# One-to-many Translation

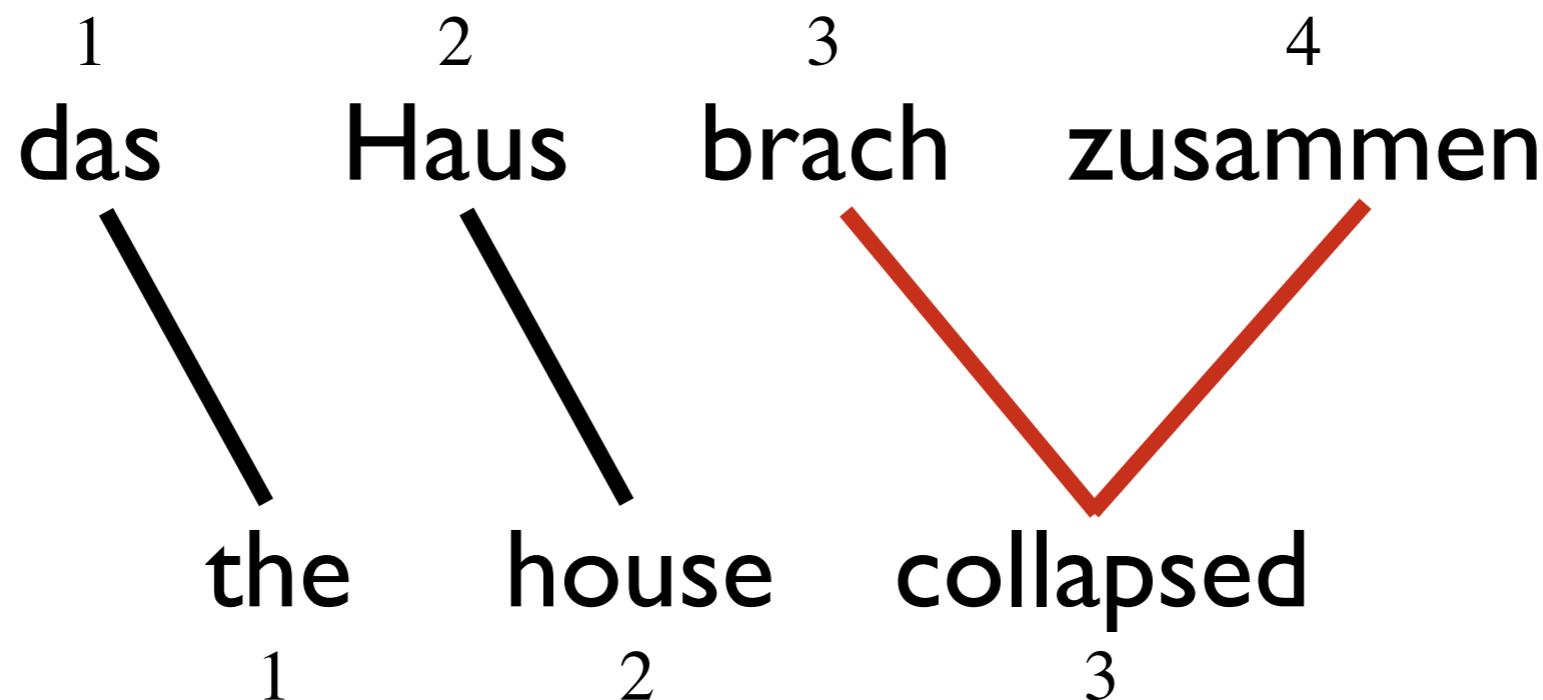

- A source word may translate into **more than one** target word

$$\mathbf{a} = (1, 2, 3, 4, 4)^\top$$

# Many-to-one Translation

- More than one source word may not translate as a unit in lexical translation

$$\mathbf{a} = ???$$

$$\mathbf{a} = (1, 2, (3, 4)^{\top})^{\top} ?$$

# IBM Model I

- Simplest possible lexical translation model
- Additional assumptions
  - The  $m$  alignment decisions are independent
  - The alignment distribution for each  $a_i$  is uniform over all source words and NULL

for each  $i \in [1, 2, \dots, m]$

$$a_i \sim \text{Uniform}(0, 1, 2, \dots, n)$$

$$e_i \sim \text{Categorical}(\theta_{f_{a_i}})$$

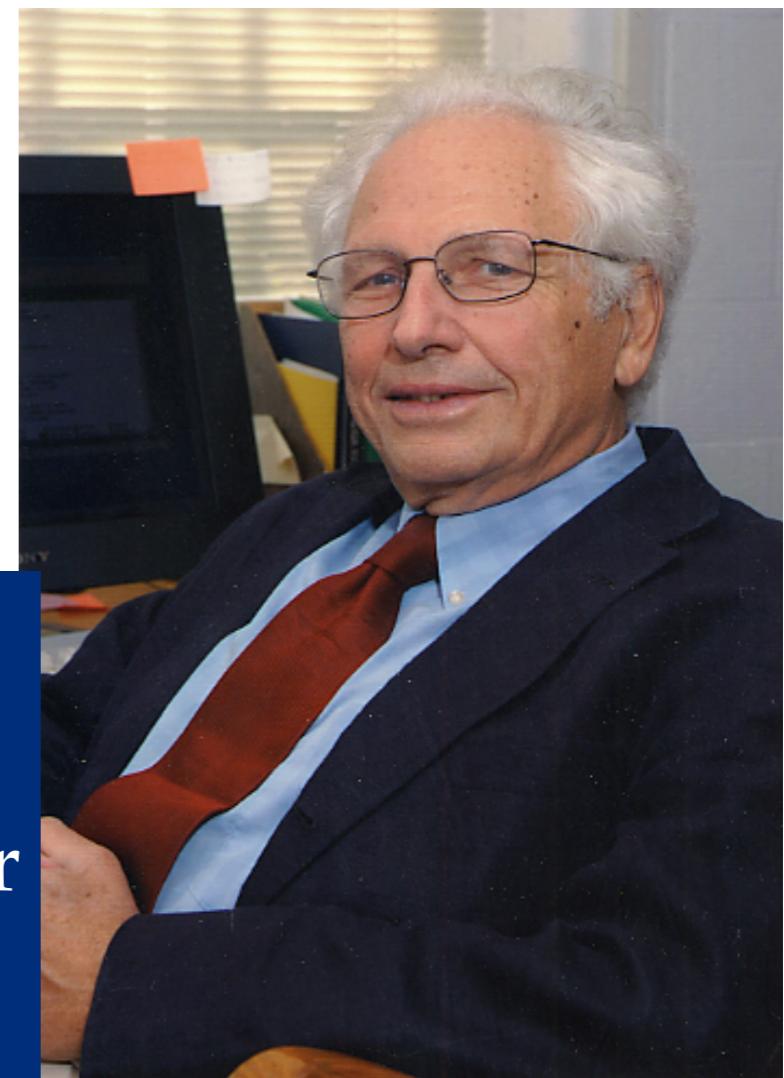

# Historical Note

## *IBM Models*

### Renaissance

“The validity of a statistical (information theoretic) approach to MT has indeed been recognized, as the authors mention, by Weaver as early as 1949. And was universally recognized as mistaken by 1950 (cf. Hutchins, MT – Past, Present, Future, Ellis Horwood, 1986, p. 30ff and references therein). The crude force of computers is not science. The paper is simply beyond the scope of COLING.”

Fred Jelinek  
(1932-2010)

The Center For Language  
and Speech Processing  
at the Johns Hopkins University

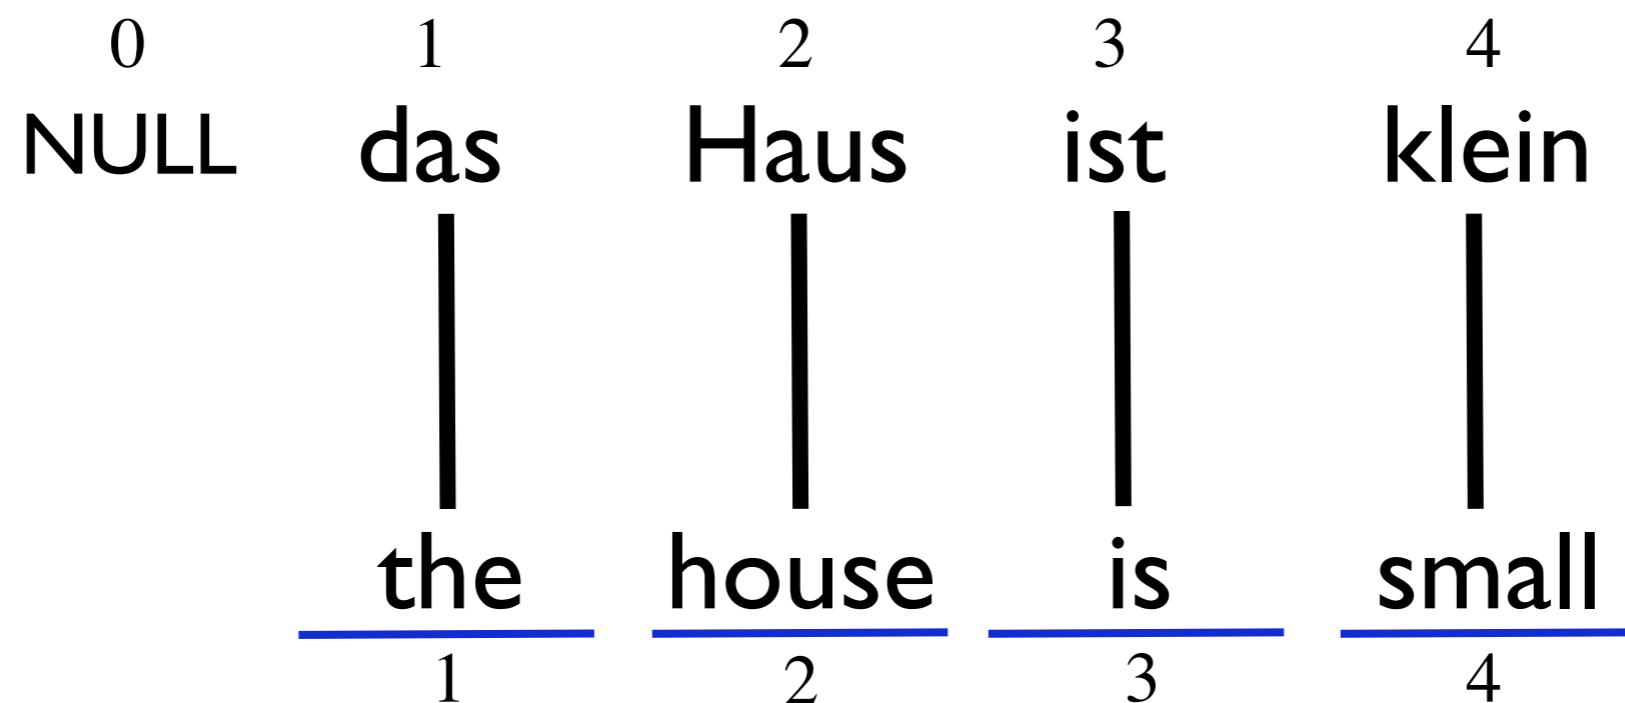

# Example

0	1	2	3	4
NULL	das	Haus	ist	klein

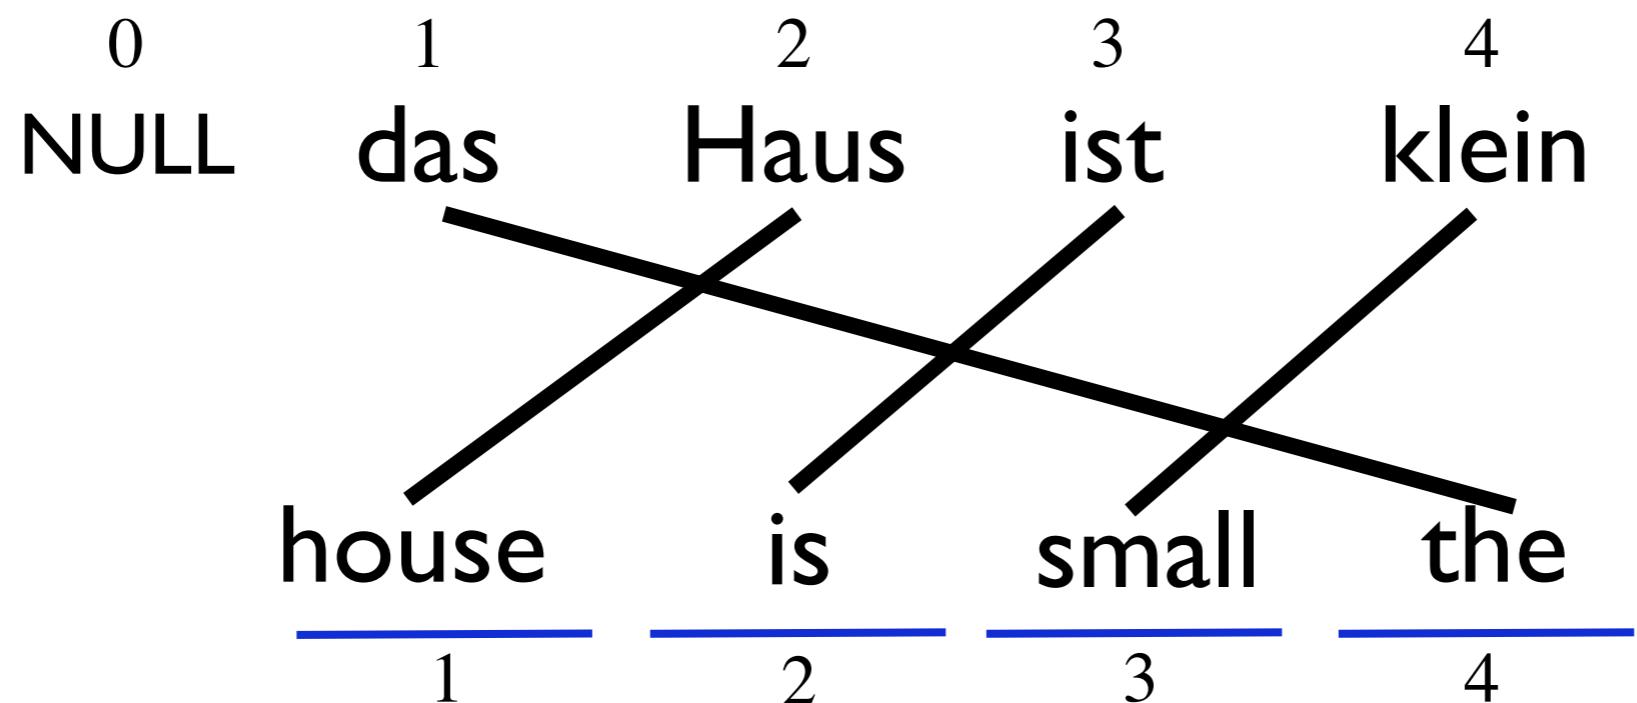

The diagram illustrates a sequence of words with indices above them. The words are: NULL, das, Haus, ist, klein. Below each word is a horizontal blue bar with a number below it, representing a target length or step value. The bars are positioned such that they overlap slightly, with the first bar ending at index 1, the second at index 2, the third at index 3, and the fourth extending to index 4.

Start with a foreign sentence and a target length.

# Example

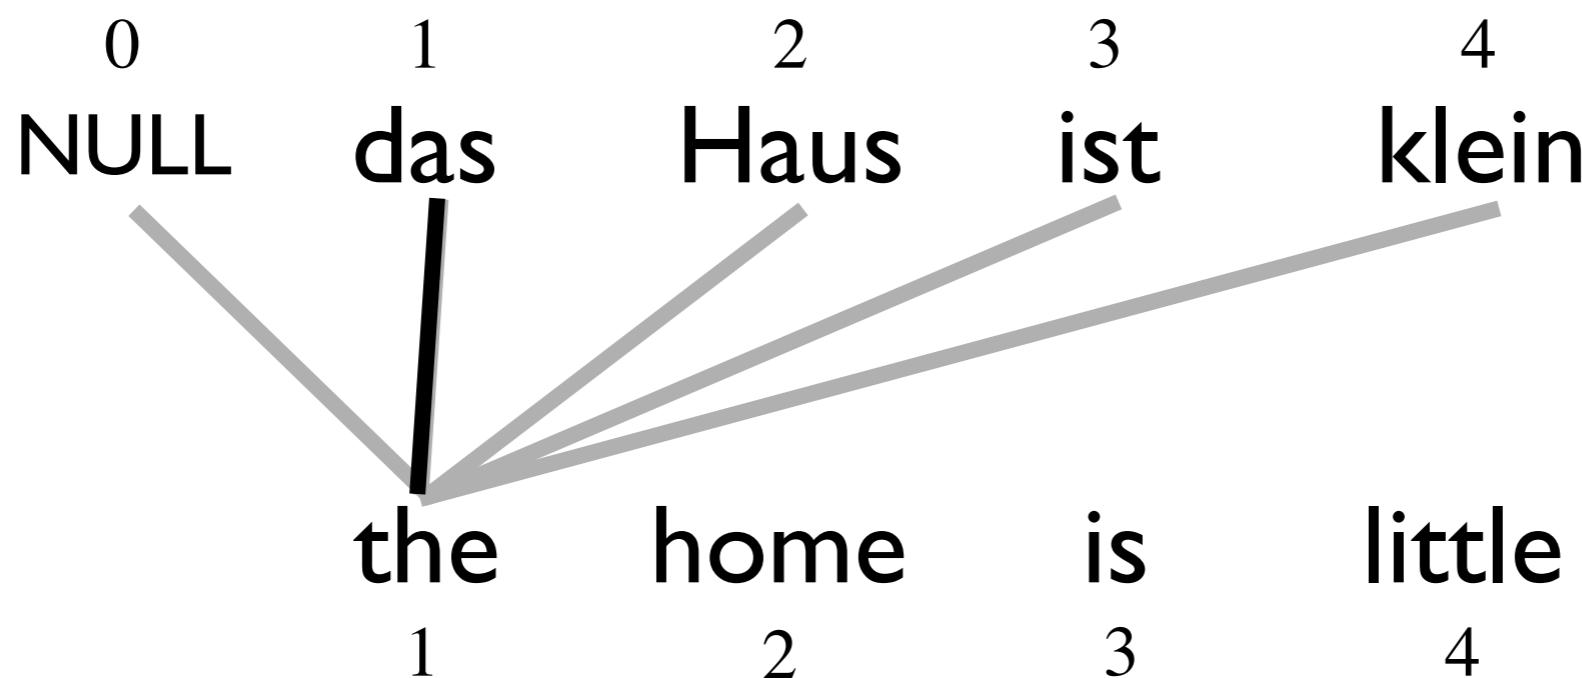

# Example

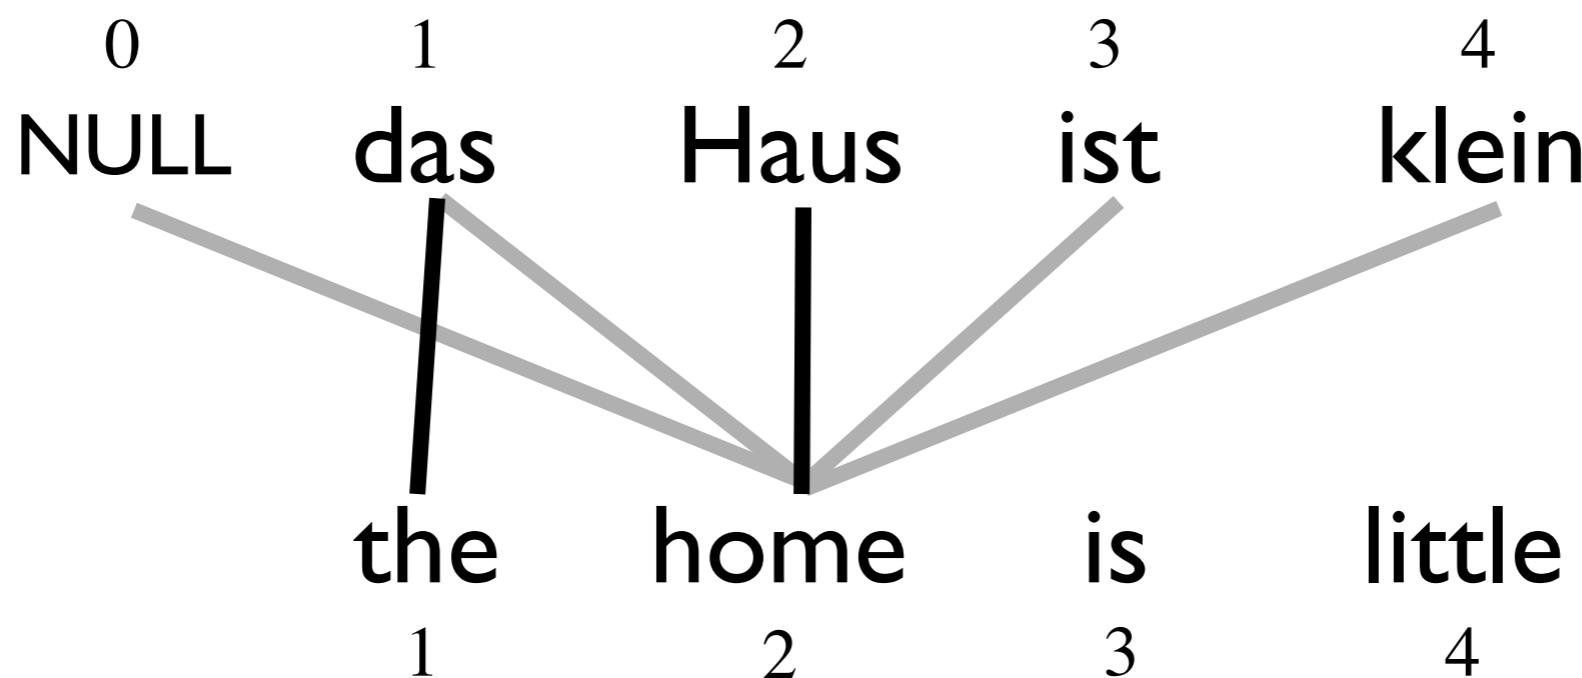

# Finding the Viterbi Alignment

$$\mathbf{a}^* = \arg \max_{\mathbf{a} \in [0,1,\dots,n]^m} p(\mathbf{a} \mid \mathbf{e}, \mathbf{f})$$

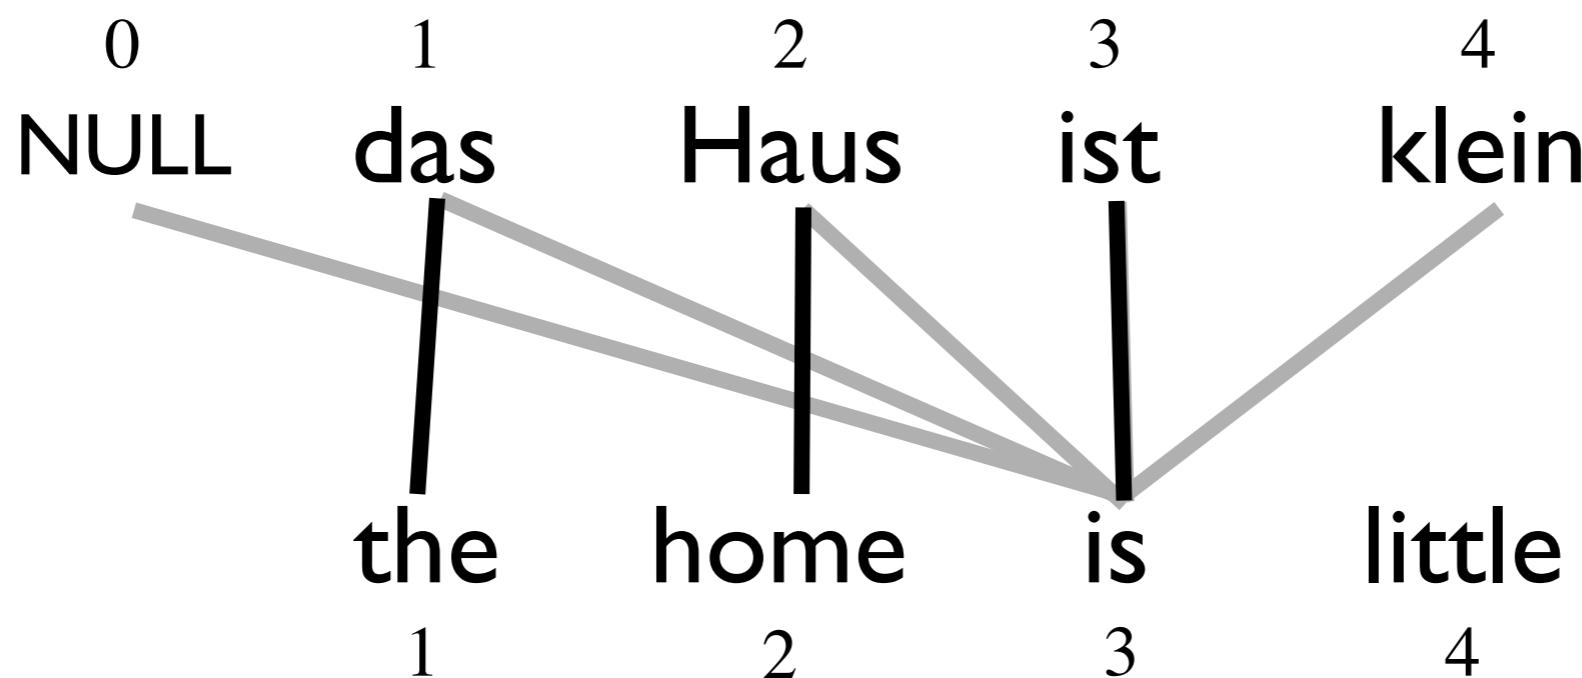

# Finding the Viterbi Alignment

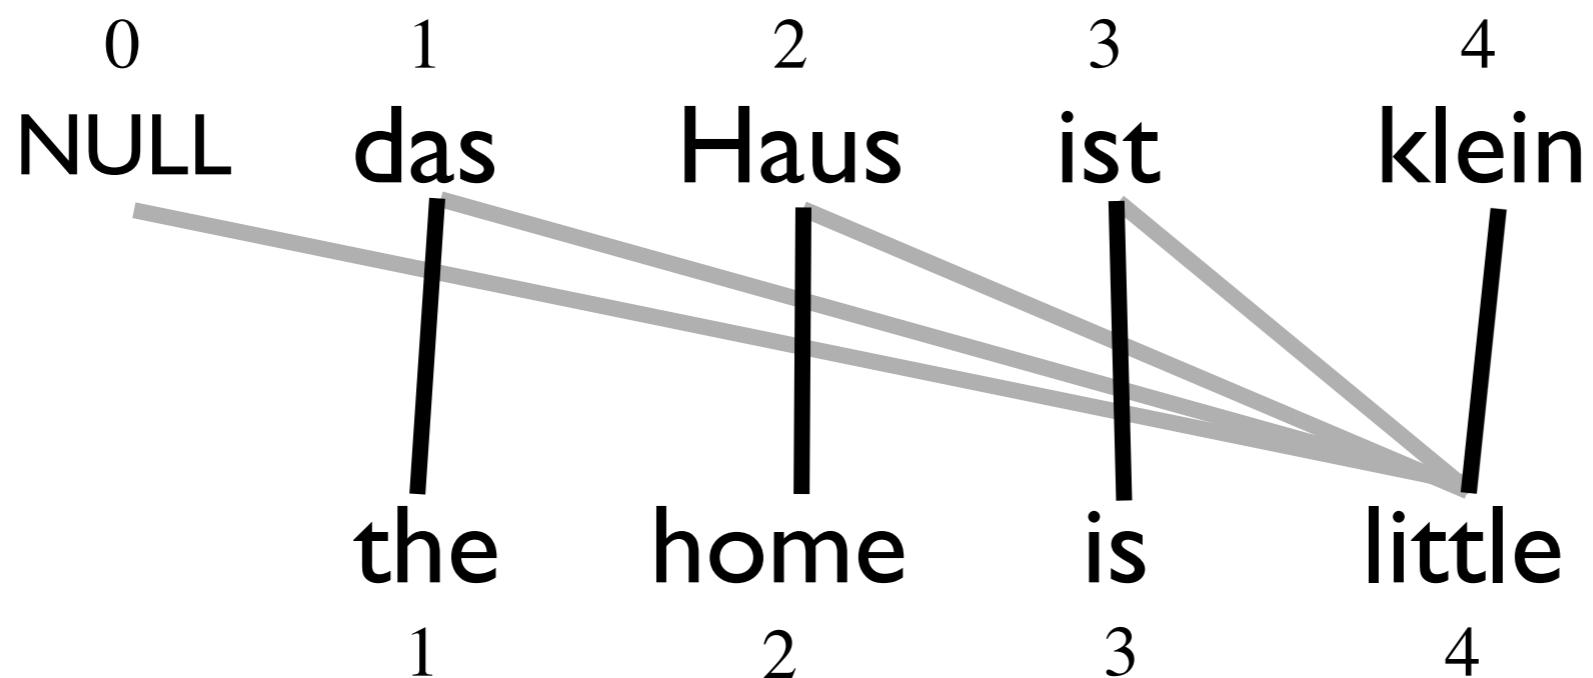

# Finding the Viterbi Alignment

# Finding the Viterbi Alignment

# Finding the Viterbi Alignment

# Historical Note #2

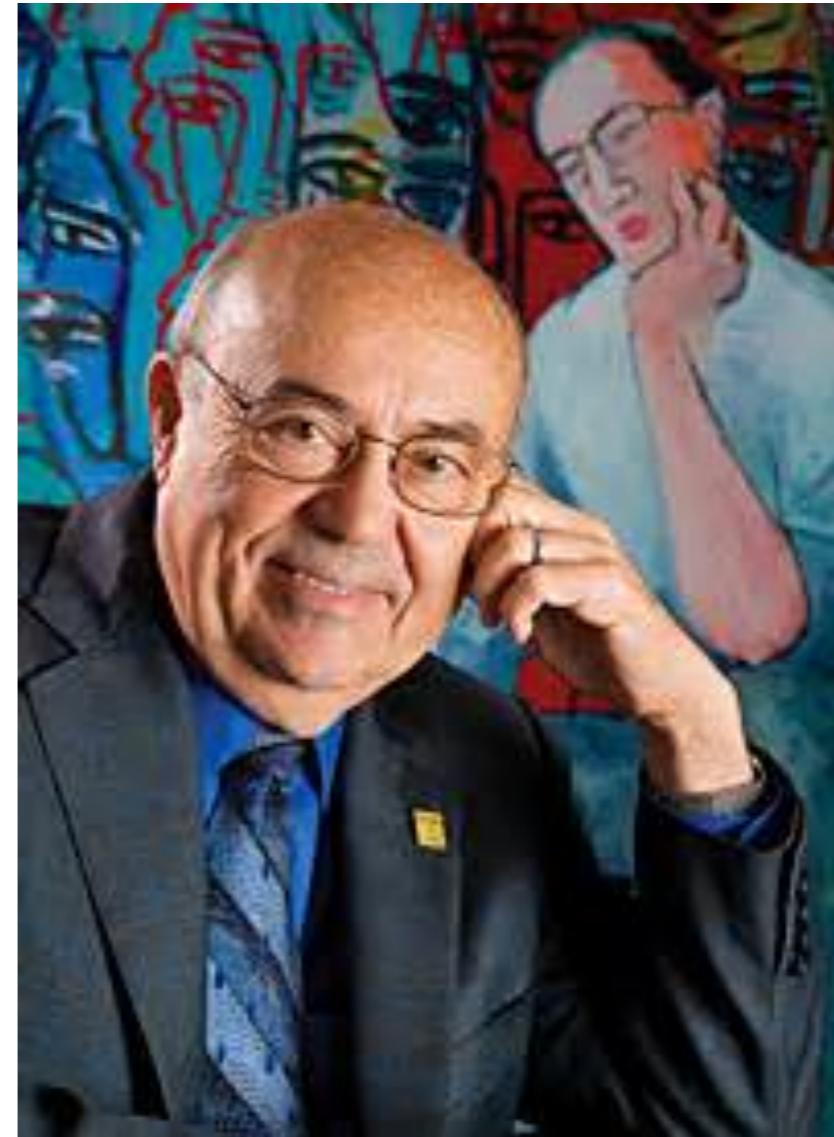

The **Viterbi algorithm** is a **dynamic programming algorithm** for finding the most **likely** sequence of hidden states – called the **Viterbi path** – that results in a sequence of observed events, especially in the context of **Markov information sources** and hidden Markov models.

*Andrew Viterbi*

*Professor at USC*

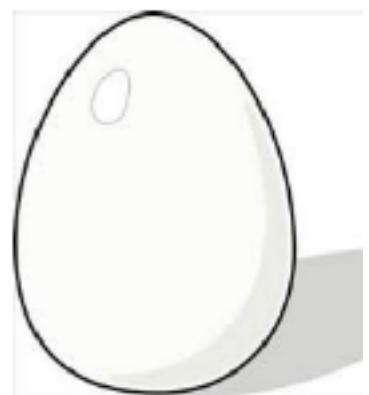

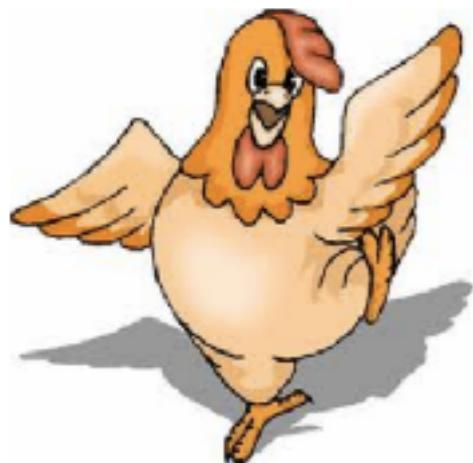

*co-founder of Qualcomm*

*classmates with Fred Jelinek*

# Learning Lexical Translation Models

- How do we learn the parameters  $p(e | f)$
- “Chicken and egg” problem
  - If we had the alignments, we could estimate the parameters (MLE)
  - If we had parameters, we could find the most likely alignments

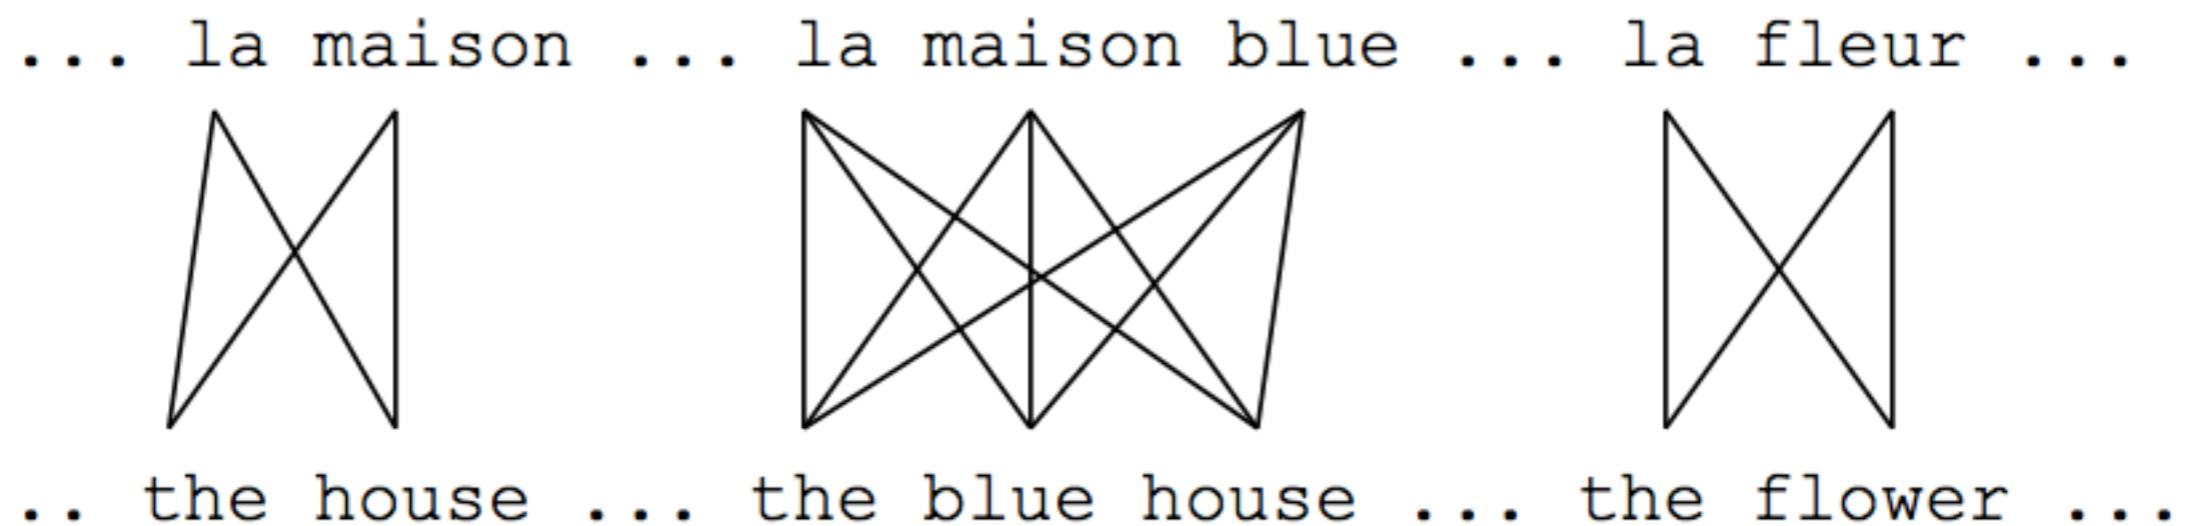

# EM Algorithm

- pick some random (or uniform) parameters
- Repeat until you get bored (~ 5 iterations for lexical translation models)
  - using your current parameters, compute “expected” alignments for every target word token in the training data

$$p(a_i \mid \mathbf{e}, \mathbf{f})$$

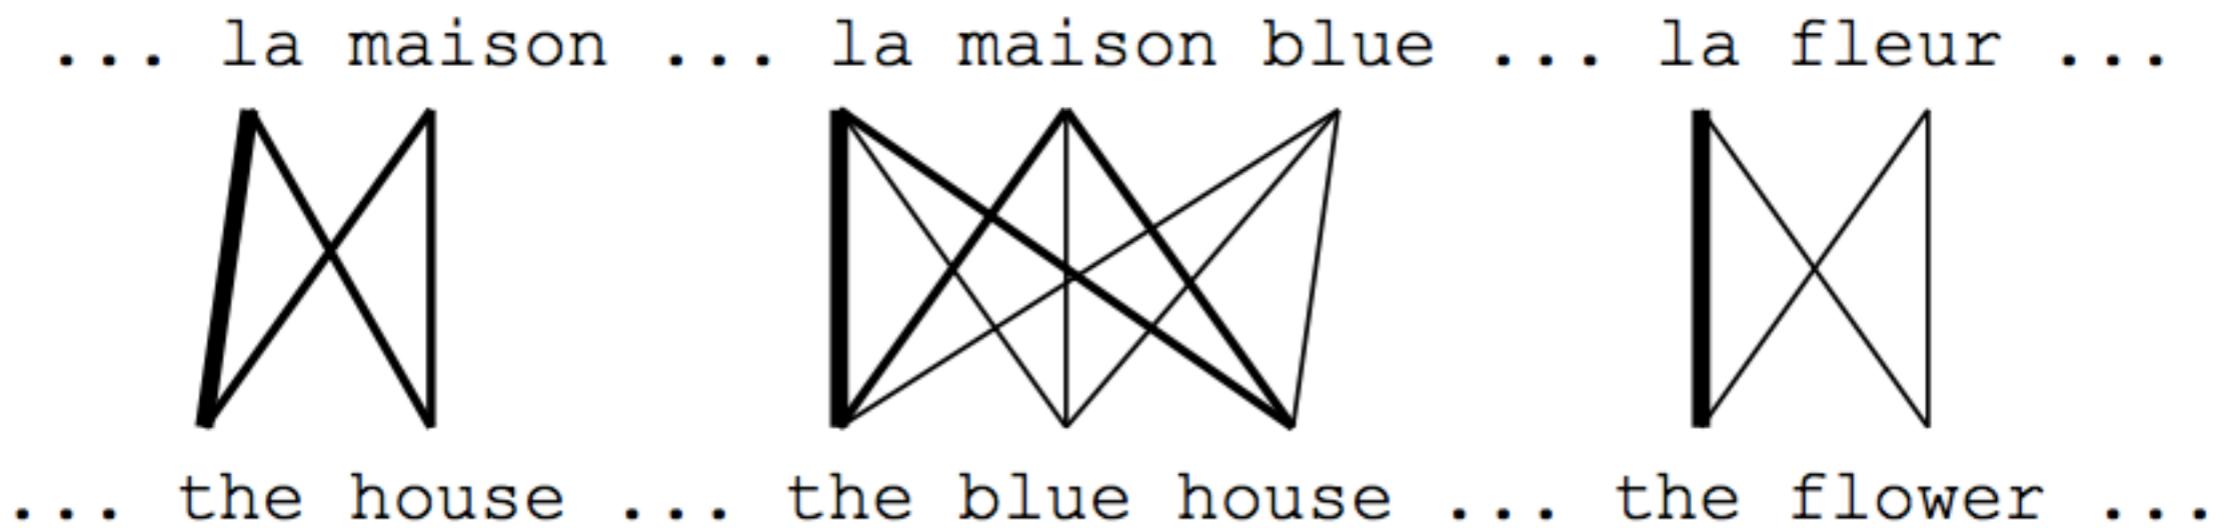

- keep track of the expected number of times  $f$  translates into  $e$  throughout the whole corpus
- keep track of the expected number of times that  $f$  is used as the source of any translation
- use these expected counts as if they were “real” counts in the standard MLE equation

# EM for Model I

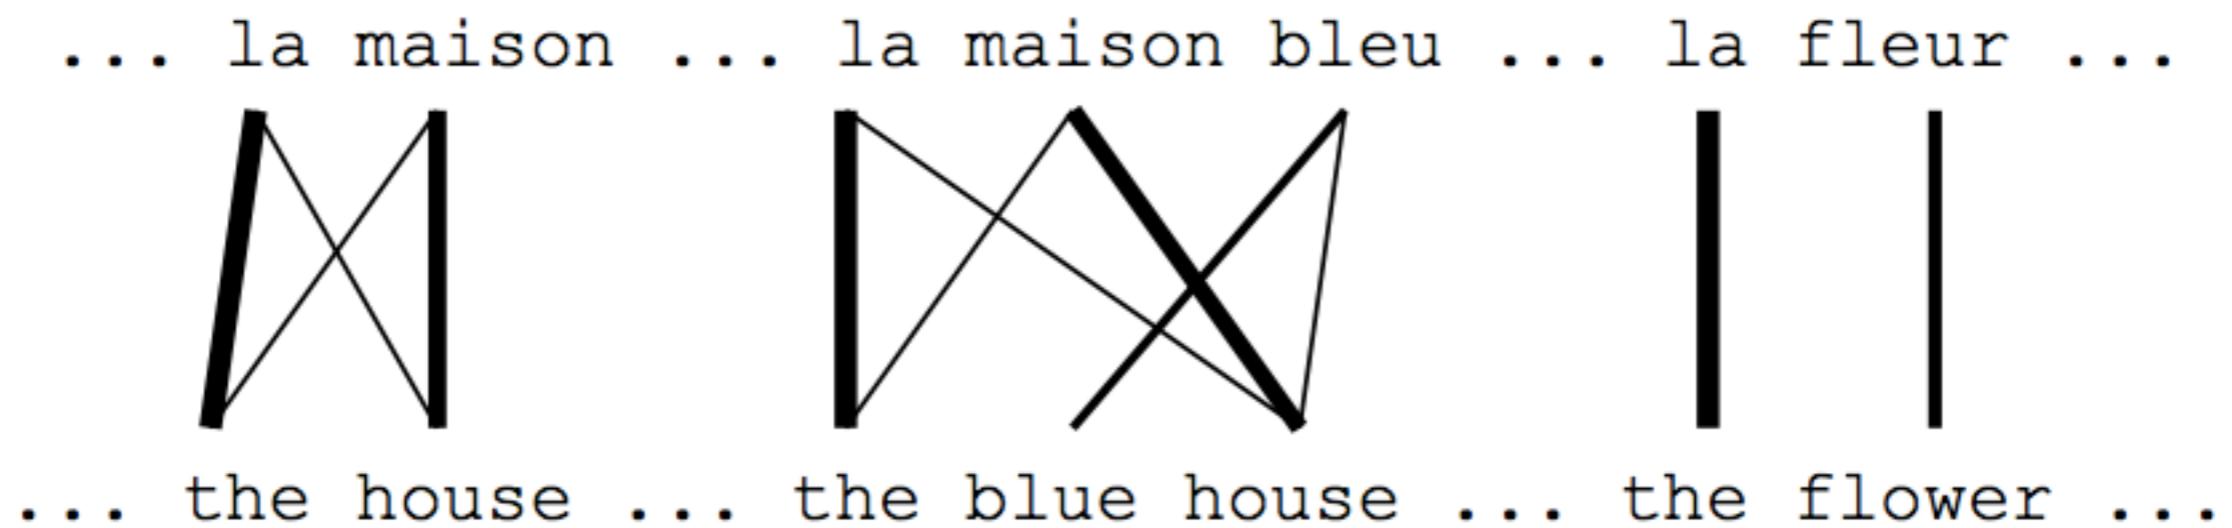

- Initial step: all alignments equally likely
- Model learns that, e.g., la is often aligned with the

# EM for Model I

- After one iteration
- Alignments, e.g., between **la** and **the** are more likely

# EM for Model I

- After another iteration
- It becomes apparent that alignments, e.g., between **fleur** and **flower** are more likely (pigeon hole principle)

# EM for Model I

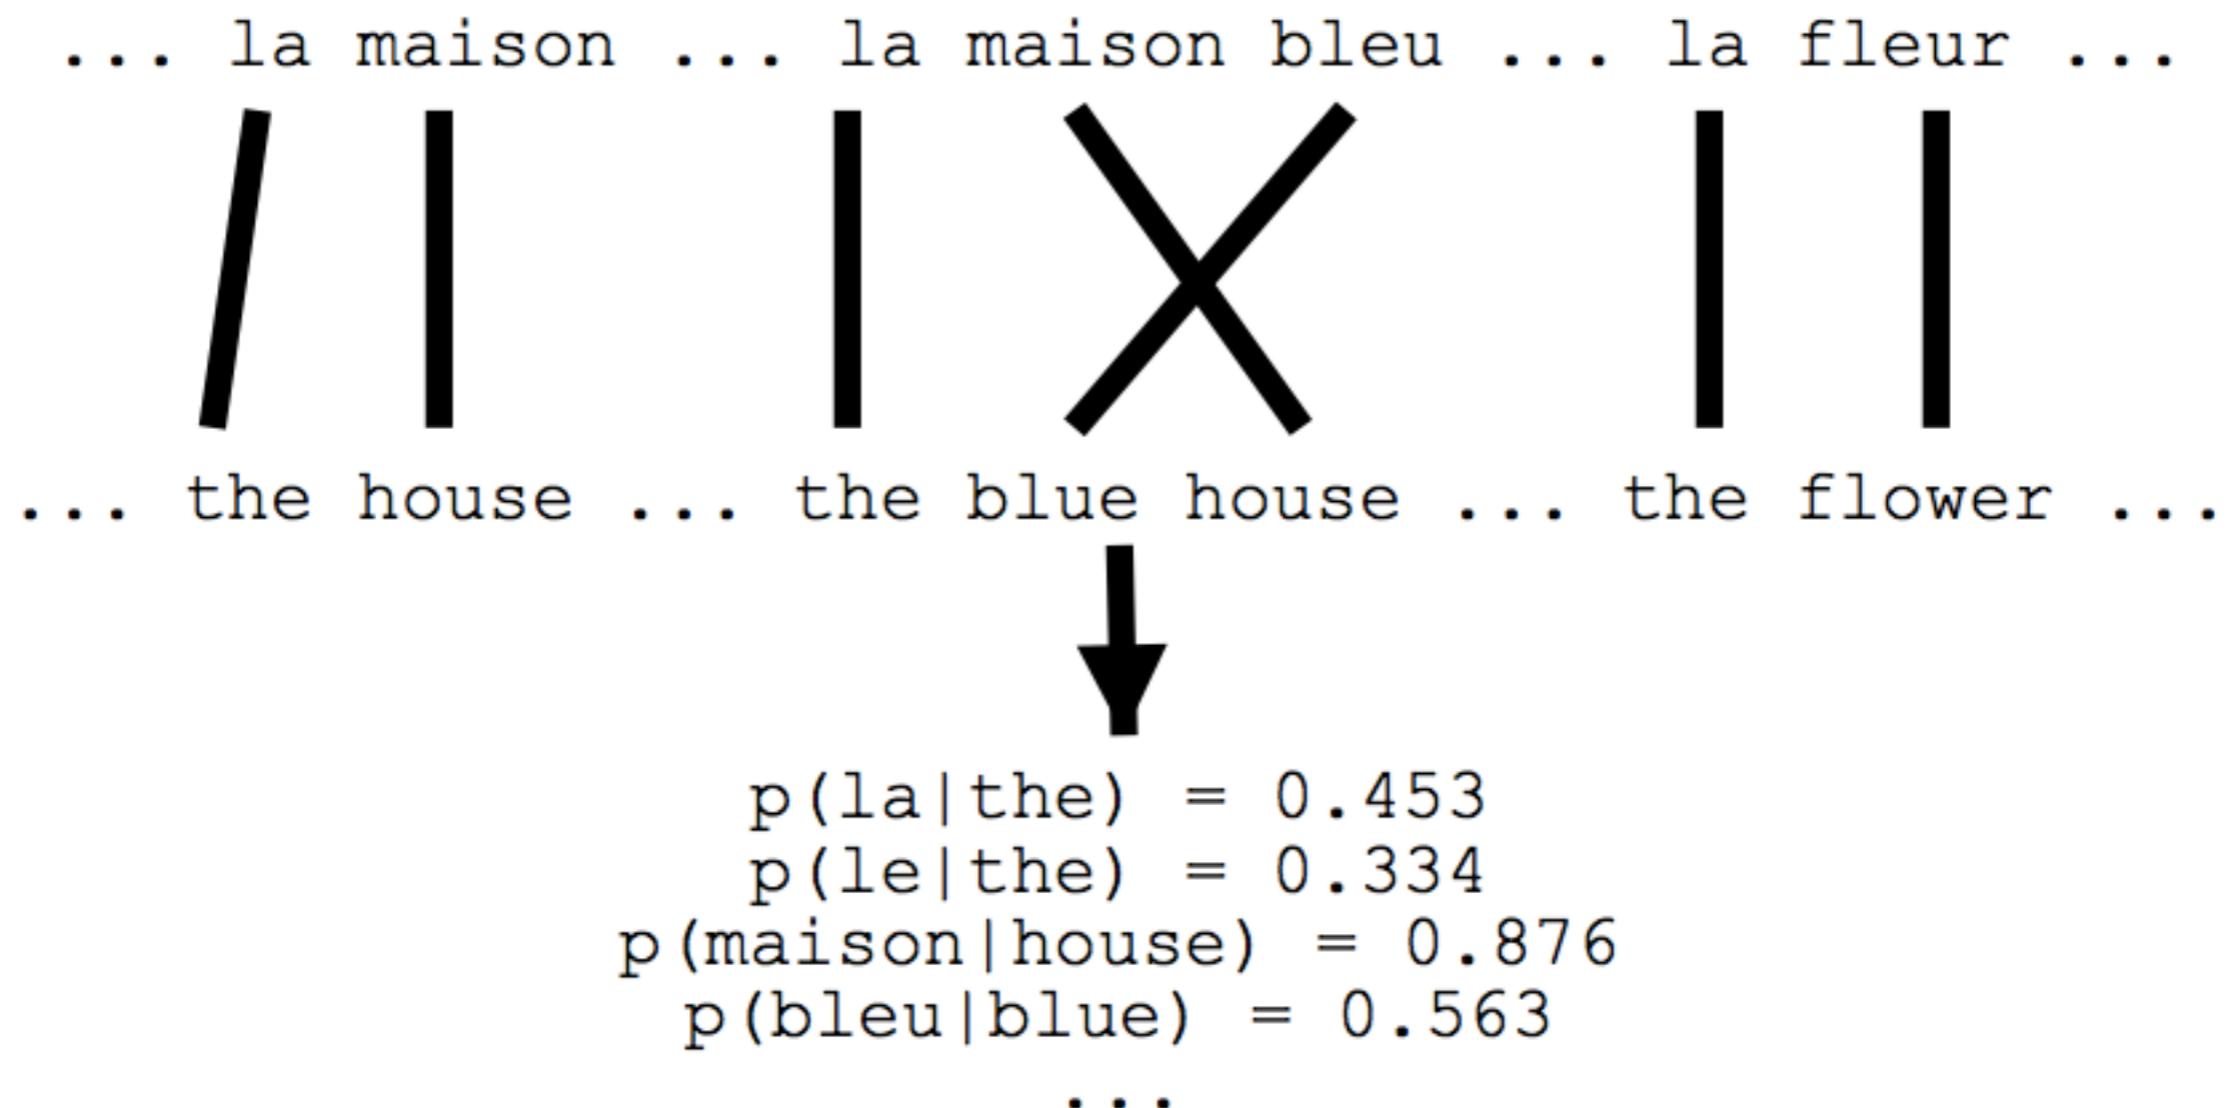

... la maison ... la maison bleu ... la fleur ...

... the house ... the blue house ... the flower ...

- Convergence
- Inherent hidden structure revealed by EM

# EM for Model I

- Parameter estimation from the aligned corpus

# Convergence

Every time I fire a linguist  
my performance goes up

- Longstanding debate about whether linguistic information can help statistical translation
- Two camps

Syntax will improve  
translation

Simpler data-driven  
models will always win

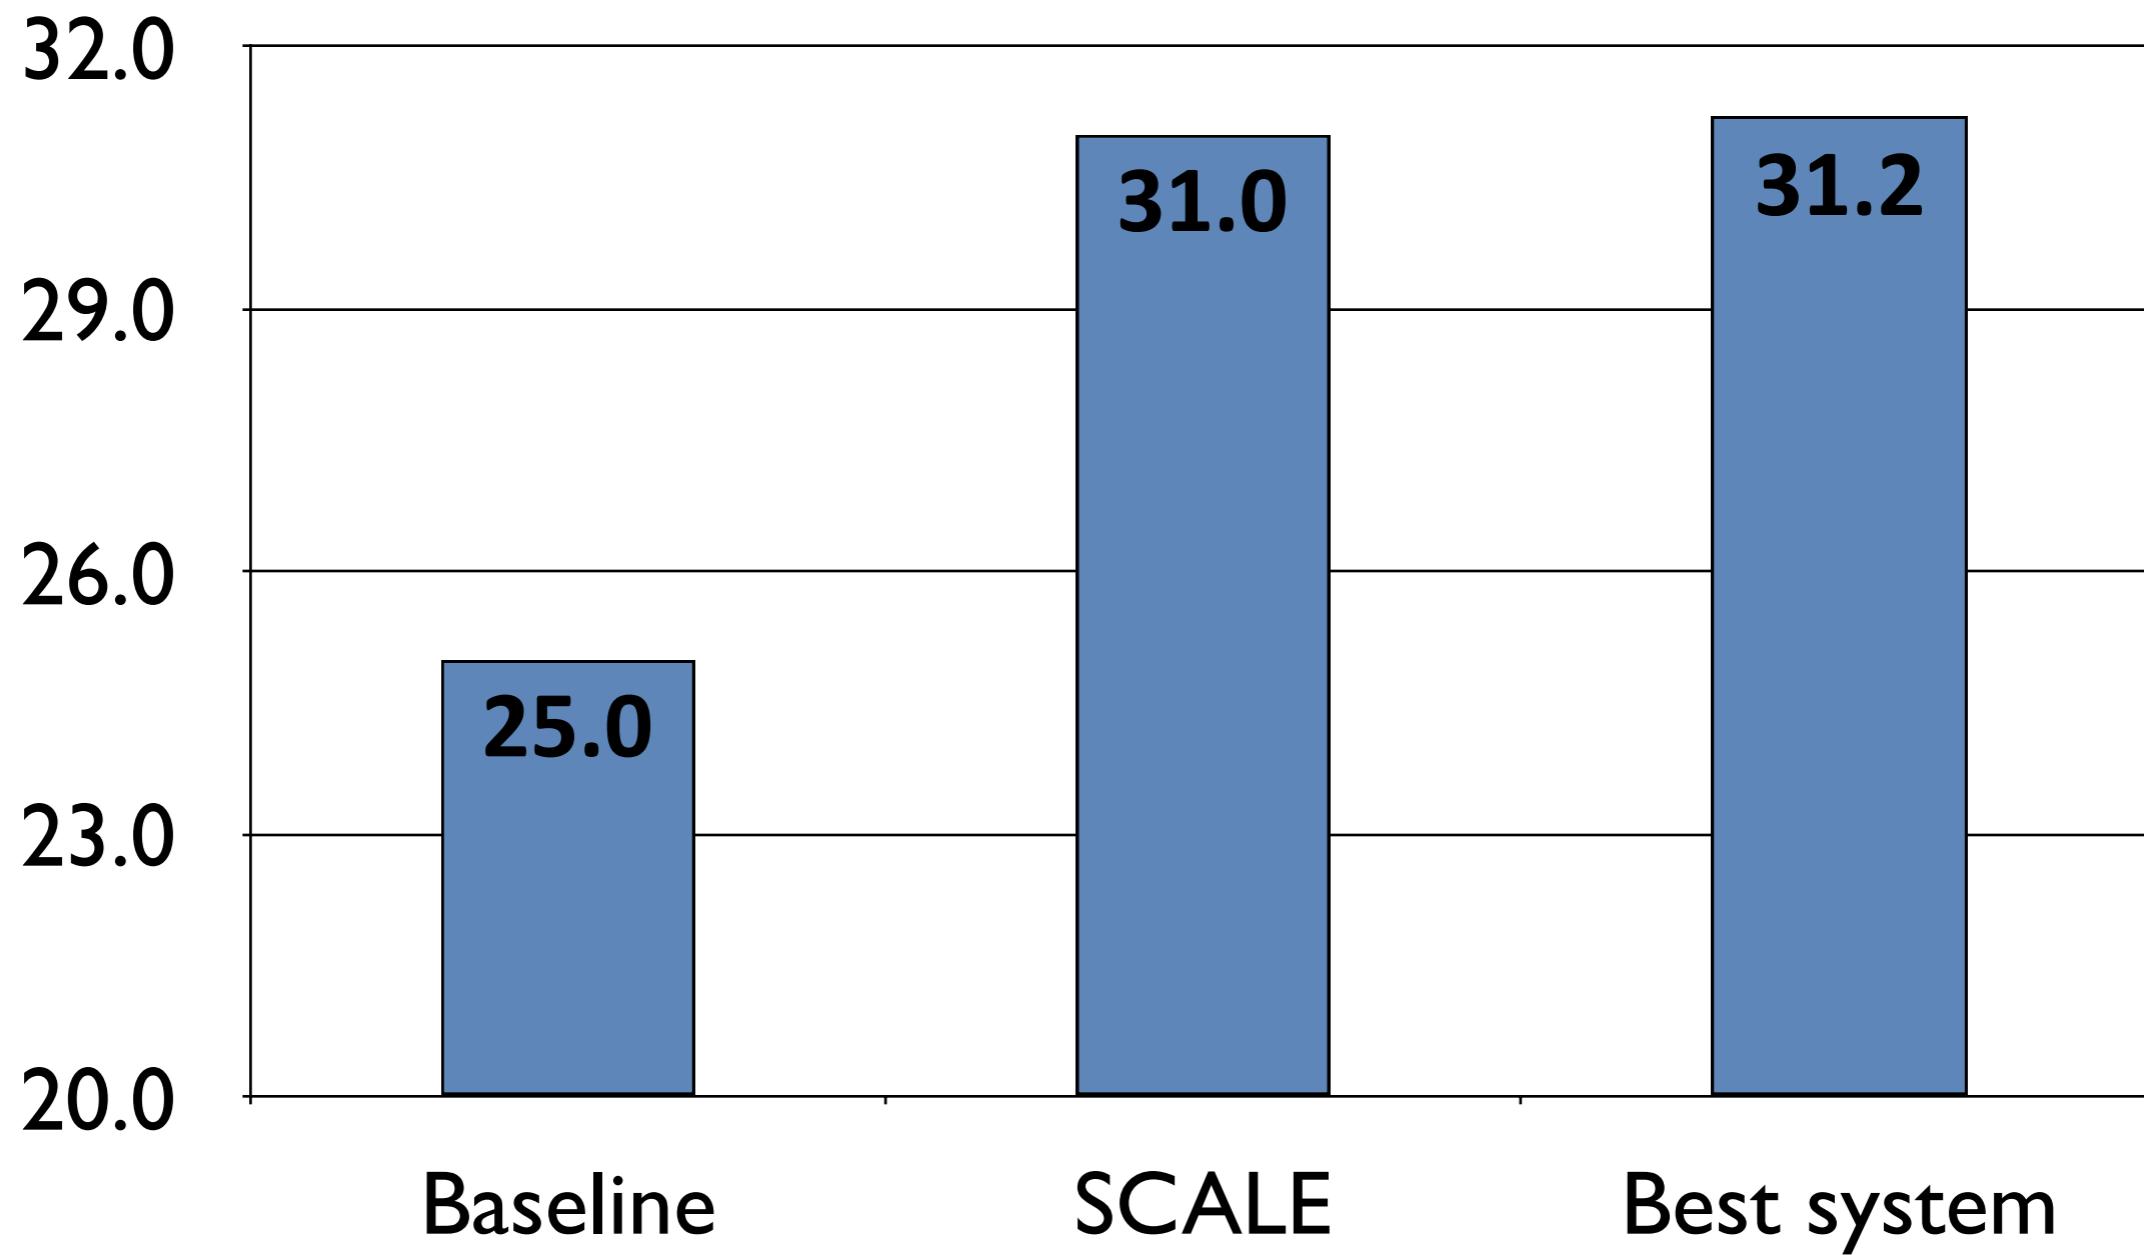

# Urdu-English Machine Translation

- Results from the SCALE summer workshop
- 20 researchers working on the problem from many different angles
- I took a gamble on syntax
- My first foray into syntactic machine translation
- Worked well. Very, very well.

# New training paradigm

- Training data: word-aligned bilingual parallel corpus, with **parse trees**
  - No need to parse the Urdu, just parse the English
  - Method is therefore transferable to other resource poor languages
- Extract SCFG rules with **syntactic nonterminals**
- For **non-constituent phrases** use CCG-style nonterminals
- **Same coverage** as Hiero model

# Syntax captures Urdu reordering

# Translation improvements

'first nuclear experiment in 1990 was'

Thomas red Unilever National Laboratory of the United States in designer, are already working on the book of Los ایلوس National Laboratory ڈینی، former director of the technical انجینئرنگ written with the cooperation of سٹلمین.

This book 'nuclear express: political history and the expansion of bomb' has been written, and the two writers have also claimed that the country has made nuclear bomb is he or any other country's nuclear secrets to چرائے or that of any other nuclear power cooperation is achieved.

**First nuclear test conducted in 1990**  
Thomas Reed, who has worked as a weapons designer at Livermore National Laboratory in the United States, has written a book in collaboration with Danny Stillman, former director of the technical intelligence division at Los Alamos National Laboratory.

In their book, 'The Nuclear Express: A Political History of the Bomb and its Proliferation,' Reed and Stillman claim that every country that has ever produced a nuclear bomb has been able to do so because it stole the nuclear secrets of another country or enjoyed the cooperation of another nuclear power.

# Who did what to whom?

## Baseline

He said that China, North Korea, Iran, Syria, Pakistan, through Egypt, Libya and Yemen is to provide nuclear technology.

Thomas was red when this question why China has provided the nuclear technology to Pakistan, In response, He said as China and India was joint enemy of Pakistan.

## Syntactic final system

He said that China would provide nuclear technology to North Korea, Iran, Syria, Pakistan, Egypt, Libya and Yemen.

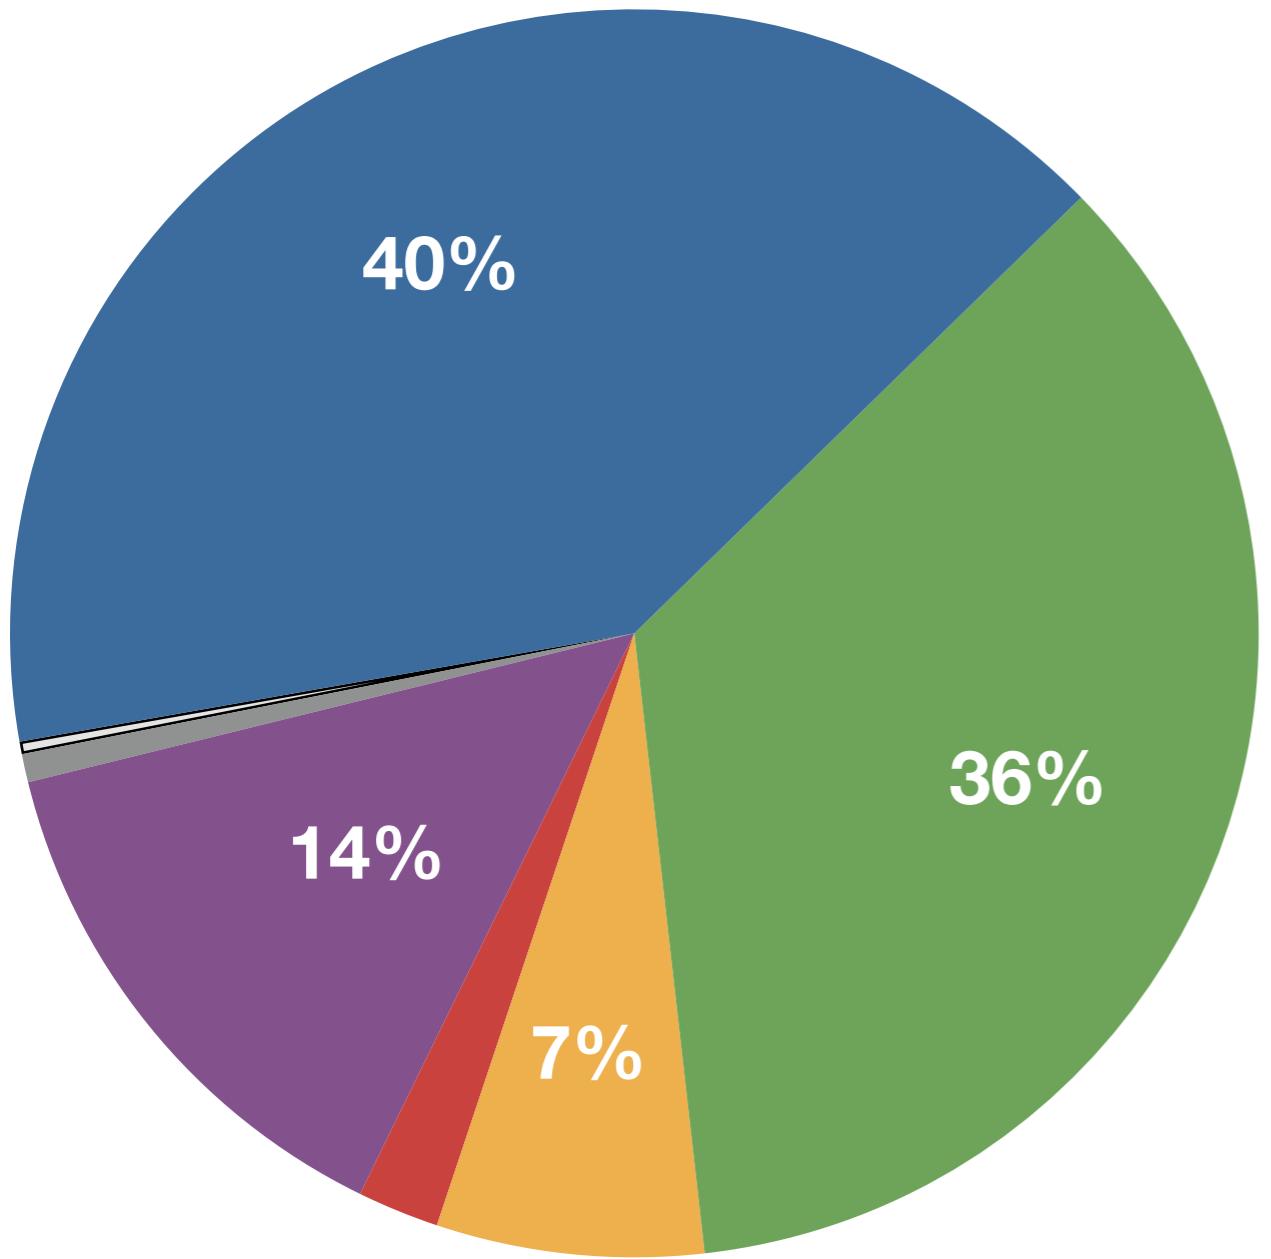

Thomas red when was this question why China has provided to Pakistan nuclear technology, he said in response to China, Pakistan and India as a common enemy.

# Why did this work?

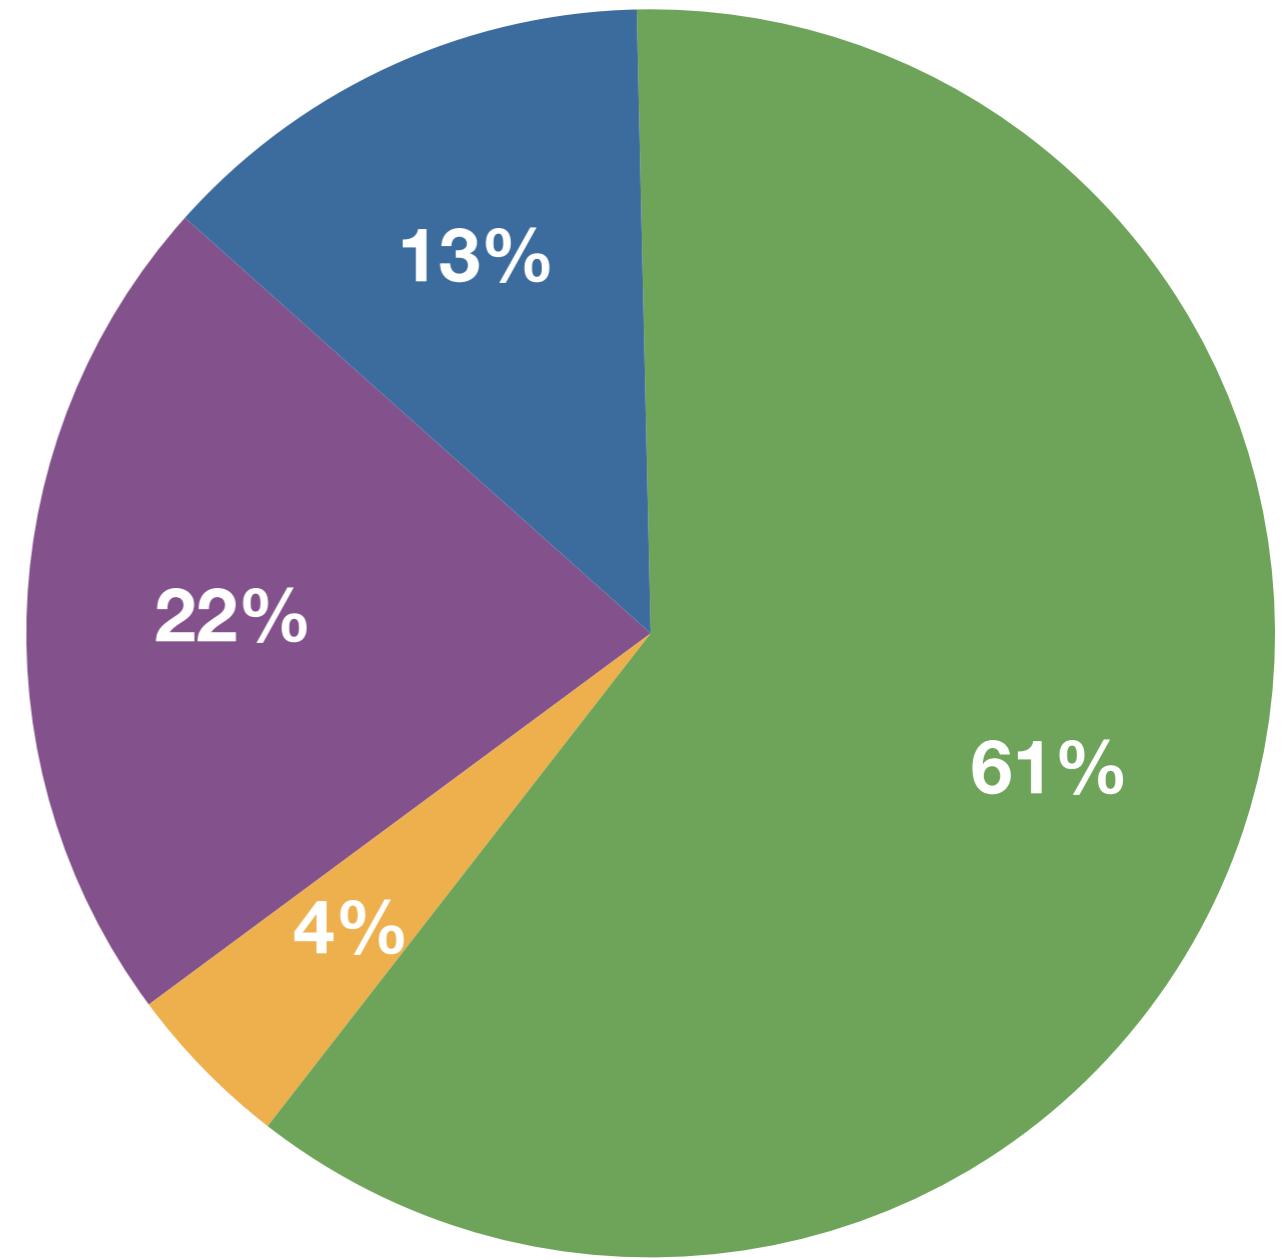

- Using **syntax-based translation models** resulted in huge improvements in quality
- Previous work on syntax did not show significant gains, so why did it work here?
- Urdu is an **ideal language** to show off the advantages of syntax
  - Very **small amount** of training data
  - Very **different word order** than English
- Can't simply **memorize** translations of phrases
- Must **generalize**

# Distribution of Word Orders
